1. The prompt:
Read and analyze the following project repository:
https://github.com/ash1eysong/STAT380_MiniProject3

Prepare some slides for a technical audience to demonstrate results from the project at the current incomplete state it is in.

2. The response

https://claude.ai/artifact/ABJFGVcFSt1Sm7fJ24oFwQ#slide-d51f1e4e23ba

3. Answers the following questions

a. Did the LLM do well or not do well at making slides and/or a script? How was the formatting?

The LLM did a good job at making each individual slide, but the overall formatting was simply too long for a 5 min presentation.

b. Did the LLM do well or not at describing the methods used in the project? Why?

The LLM did not do well at describing the methods used. It only listed results from the model and not how the models worked.

c. Did the LLM do well or not at picking the most variables of your project? Why?

The LLM did a good job at picking the variables used in the completed LASSO and Decision Tree models. In the qmd file, we listed out the best variables in each of those models, so it was able to regurgitate that.

d. Did the LLM do well or not at making the result in the style of a work presentation to a team and an appropriate audience? Why or why not?

The style of the presentation slides were good, they were simple and included graphs, and had good formatting. We think it is a good starting point but could be improved on, making sure that all the information and data is correct, inserting our own visualizations, and finish it since we have not completed our code document.
